N

The invention relates to a composition useful for treating or preventing mycoplasma infection in a subject suffering from a disorder characterised CC by increased cell proliferation or by co-infection with a second microbe, compositions an agent that prevents or inhibits shalls caid-mediated compositions of the invention may be described as; antiatherosclerotic, compositions are useful to treat diseases associated with undesirable antibacterial, antiviral, anti-HIV, cytostatic and vasotropic. The compositions are useful to treat diseases associated with undesirable malignancy, by reducing or preventing mycoplasma infection. Examples of colon cancer, lung cancer and leukaemia. They are also useful to treat diseases associated with infection with other infections organisms colon cancer, lung cancer and leukaemia. They are also useful to treat septically human immunodeficiency virus or chlamydia species. They can be used to treat such diseases in humans or other animals, and con be administered in conjunction with conventional agents e.g. anti-colon cancer in conjunction with conventional agents e.g. anti-colon cancer in conjunction with conventional agents e.g. anti-colon cancer in cantuctic agents. The current sequence represents the xxx plasmid encoding the catalytic trans-sialidase unit of T. cruzi Fig 25; 63pp; English Claim 12; &\$66666666666666666666666666666666666

construction and a second microbe. Mycoplasmas are parasites of the respiratory epithelium and urogenital tract. Infections are typically segment to be co-factors in diseases such as AIDS and in sequelae after mycoplasma infections having an autoimmune basis. The agent prevents or inhibits sialic acid-mediated attachment of mycoplasma or co-cells of the subject and is an antibiotic or an enzyme having an carivity consisting of neuraminidase and/or trans-sialidase activity. The enzyme is derived from a Trypanosoma cruzi microorganism, where the caryme is antive or a recombinant enzyme. Results showed that trans-cary mycoplasmas from the neoplastic cells leading to their apoptosis. The composition or the agent that prevents or inhibits mycoplasma infection is useful for manufacturing a medicament for treating or preventing a disorder associated with increased cell proliferation, e.g. atherosclerotic vascular disease or malignant disease (tumour), or a disease associated with co-infection with mycoplasma and a second microbe such as human immunodeficiency virus or a Chlamydia microbe. The sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ATGGCACCCGGATCGAGCCGAGTTGAGCTGTTTAAGCGGCAAAGCTCGAAGGTGCCATTT 120

The present sequence encodes Trypanosoma cruzi alpha(2-3) trans-
staldase. The protein is used in the method of the invention to produce
staldase. The protein is used in the method of the invention to produce
staly1-oligosaccharides, particularly staly1lactose, which are produced
by treating a dairy source such as a cheese processing waste strain with
an alpha (2-3) trans-staldase. The method can be used for producing
staly1-oligosaccharides, such as (2-3)sialy1lactose for pharmaceutical
use. (2-3)staly1lactose has been shown to neutralise enterotoxins of
various pathogenic microbes including E. coli, vibrio cholerae and
(alpha-Neu3A-(2-3)-Gal-beta-(1-4)-GlC) interferes with colonisation of
telicobacter pylori and thereby prevents or inhibits gastric and duodenal
ulcers. (2-3)staly1lactose has additionally been proposed to inhibit
immune complex formation by disrupting occupancy of the Fc carbohydrate
binding site on IgG and to be useful in treating arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of sialyl-oligosaccharides, particularly sialyl-lactose - by treating a dairy source such as a cheese processing waste stream with an alpha (2-3) trans-sialidase.

The present sequence encodes a functional Trypanosoma cruzi alpha(2-3) trans-sialidase which lacks amino acid repeats. The protein is used in the method of the invention to produce siallyl-oligosaccharides, particularly sialyllactose, which are produced by treating a dairy source such as a cheese processing waste strain with an alpha (2-3) transsialidase. The method can be used for producing sialyl-oligosaccharides, such as (2-3) sialyllactose for pharmaceutical luse. (2-3) sialyllactose for pharmaceutical luse. (2-3) sialyllactose including E. coli, vibrio cholerae and Salmonella. It has also been shown that alpha(2-3) sialyllactose (alpha-Neu5Ac-(2-3)-Gal-beta-(1-4)-Glc) interferes with colonisation of Helicobacter pylori and thereby prevents or inhibits gastric and duodenal ulcers. (2-3) sialyllactose has adductionally been proposed to inhibit immune complex formation by conserved. Production of sialyl-oligosaccharides, particularly sialyl-lactose - by treating a dairy source such as a cheese processing waste stream with an alpha (2-3) trans-sialidase. Sequence 1929 BP; 442 A; 463 C; 590 G; 434 T; 0 U; 0 Other; Disclosure, Fig 3; 84pp; English. useful in treating arthritis

condition selected from: Transmission included and an interleukin-6 (IL-6) secretion inducing peptide appearing as ADC21513 or ADC21511 called C44 and C14, or its variant, and an interleukin-6 (IL-6) secretion inducing peptide appearing as ADC21513 called TR-1 (terminal repeat 1). Also peptide are a composition comprising the peptides, fusion protein comprising the peptides, fusion partient protein and a physiological acceptable carrier, providing trophic support for neurons or glial cells in a mammal (comprising a therapeutically effective amount of T. cruzi transcally effective amount of T. cruzi transcallidase (TS) or a neurotrophic variant) and stimulating (M3) the secretion of IL-6 (interleukin-6) in a mammal comprising administering TS or an IL-6 inducing variant. The fusion partner comprises a mammalian corresponded for the condition selected from: amyotrophic lateral sclerosis, Alzheimer's disease, parkinson's disease, parkinson's disease, (LIP). The peptides are useful in providing trophic support for neurons and glial cells in a mammal suffering a condition selected from: amyotrophic lateral sclerosis, Alzheimer's disease, parkinson's disease, (Abagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Ghagas' Compandant of IL-6. The present sequence encodes trans sialidase clone to be a condition of IL-6. The present sequence encodes trans sialidase clone
                                                                                                                                                                                                                                                                        T. cruzi trans-sialidase derived neurotrophic and interleukin-6 secretion inducing peptides, useful in the treatment of neuronal degeneration caused for example by Chagas' disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AGAGACTGGGATATTCTGCTTGCCGTTGGTGAGGTCACGAAGTCCACTGCGGGGGGGCAAG 498

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GATTTTGGCTGCTCTGAACCTGTGGCCCTTGAGTGGGAGGGGAAGCTCATCATAAACACT 792
                                                                                                                                                                                                                                                                                                                                                                                                                  Clones 121 and 151, isolated from T.cruzi DNA library by homology to known neuramidase sequences, were found to have identical sequences in the region of the trans-sialidase gene necessary for enzymatic activity. The 121/151 nucleotide sequence (AAQ4955) is similar to the known TCNA sequence (AAQ49556) but distinct from the sequence of clone 154 (AAQ49597). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                           New trans-sialidase polypeptide(s) isolated from Trypanosoma - used fo
transferring sialic acid or for treating or preventing trypomastigote

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   972
                                                                                                                                                                                                                                                                                                                                              9
                                                                                                              Clones 121 and 151, isolated from T.cruzi DNA library by homology to known neuramidase sequences, were found to have identical sequences in the region of the trans-sialidase gene necessary for enzymatic activity. The 121/151 nucleotide sequence (AAQ49555) is similar to the known TCNA sequence (AAQ49596) but distinct from the sequence of clone 154 (AAQ49597). (Updated on 25-MAR-2003 to correct PN field.)
                             for
                          New trans-sialidase polypeptide(s) isolated from Trypanosoma - used for transferring sialic acid or for treating or preventing trypomastigote
                                                                                                                                                                                                                                                                                                                  613 GCGTCCAACGGGAATCTTGTGTACCCTGTGCAGGTTACGAACAAAAAGAAGCAAGTTTTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Clones 121 and 151, isolated from T.cruzi DNA library by homology to known neuramidase sequences, were found to have identical sequences in the region of the trans-sialidase gene necessary for enzymatic activity. The 121/151 nucleotide sequence (AAQ49559) is similar to the known TCNA sequence (AAQ49596) but distinct from the sequence of clone 154 (AAQ49597). N.B. the TCNA sequence shown in the SEQ.ID.Listing No.5 has the G nucleotide at position 486 missing. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                613 GCGTCCAACGGGAATCTTGTGTACCCTGTGCAGGTTACGAACAAAAAGAAGCAAGTTTTT

This is a full length coding sequence from strain Y of T. cruzi. This sequence is used to construct a recombinant T. cruzi CRP eukaryotic expression cassette. Recombinant CRP produced from host cells can be used as a vaccine to prime the immune system of an animal. Hybridomas secreting monoclonal antibodies recognising CRP are produced. This is used to detect chagas's disease-related proteins and for treatment of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               encoding Trypanosoma cruzi complement regulatory protein, t of Chaga's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TCACGCGTGTGGGGCAACTCACGTACACGTGTGGGGCACGGCGCGCAGGGTGGCTTCGTC 981
decay accelerating factor gene, which is recognised by mammalian cells. This was used in the construction of the plasmid pRCISBI-CRFDAF for production of recombinant CRF in mammalian cells. Recombinant CRF produced from host cells can be used as a vaccine to prime the immune system of an animal. Hybridomas secreting monoclonal antibodies recognising CRP are produced. This is used to detect Chagas's diseaserelated proteins and for treatment of the disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TACCCTGTGCAGGTTACGAACAAAAGAAGCAAGTTTTTTCCAAGATCTTCTACTCGGAA

It is the 5' end of an isolated clone; the 3' end is given in AAT69168. A full-length antigen (see AAW26541) is encoded by this sequence. 22 isolated DNA molecules (AAT69151-72) encode full-length antigens (see AAW16904-10, or epitope-containing repeats (see AAW18094-102, AAW19079-86 and AAW26542-44) of native antigens, that can be used in a variety of immunoassays for detecting T. cruzi infection in a blood, serum, plasma, saliva, cerebrospinal fluid or urine sample. The polypeptides are also useful in vaccines and pharmaceutical compositions for inducing saliva, cerebrospinal fluid or urine sample. The isolypeptides are also protective immunity against Chagas disease. The isolated DNA molecules can be used for recombinant production of the antigenic polypeptides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 828
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               946
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes new Trypanosoma cruzi epitopes. A method for detecting Trypanosoma cruzi infection in a biological sample comprises contacting the sample with a polypeptide comprising an epitope of a TC antigen, or a variant of the antigen that differs only in conservative substitutions and/or modifications and detecting the presence of antibodies that bind to the polypeptide in the sample, thereby detecting antibodies that pind to the polypeptide in the sample, thereby detecting protection. The TC polypeptides can be used in vaccines for inducing protective immunity against Chagas' disease in a patient. The polypeptides and antibodies can also be used for detecting TC infection. AAX81740-61 represent nucleotides that encode TC epitopes from antigenic

The present sequence is a coding sequence for a recombinant human (fibroblast growth factor 2 (FGF2) dimer. The encoded protein includes a fibroblast growth factor 2 (FGF2) dimer. The encoded protein includes a comprising 2 FGF monomers linked to one another and including at least come modification in an FGF monomer. The 2 monomers are preferably FGF2 monomers. Modifications include the replacement of a non-cysteine amino acid residues by a cysteine residue and the deletion of the 9 N-terminal and a read a residue by a cysteine residue and the deletion of the 9 N-terminal and a read are preferably FGF2 mino acid residues of at least one of the monomers. The resulting FGF dimer is used in claimed methods for promoting signal transduction, treating stroke, promoting angiogenesis, promoting sound healing, promoting collateral blood vessel formation, promoting nerve regenerating, preventing central or peripheral nervous system disease (e.g. Alzheimer's disease or Parkinson's disease). The FGF dimer can also be used to screen for compounds having FGF inhibitor activity. Such anglogenesis, treating chronic inflammation, and treating or preventing angiogenesis, treating chronic inflammation, and treating or preventing cancer, inhibiting anglogenesis, treating chronic inflammation, and treating or preventing cancer.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 3, Al

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
